

PRIMARY, SECONDARY, TERTIARY, AND COMPLEMENTARY COLORS

There are only three **primary colors**: red, blue, and yellow. Every other color can be made by mixing different combinations of the primary colors (along with white or black). For example, the **secondary colors** are made from equal portions of two primary colors, as you can see, below.

The **six tertiary colors**, which are yellow-orange, red-orange, red-purple, blue-purple, blue-green, and yellow-green, are made by mixing a primary color with the secondary color nearest to it. For example, yellow and orange make yellow-orange, and red and orange make red-orange.
